

Abstract

A system and method for implementing selection of information networks by the user: the system includes at least two information networks and a user terminal, and further comprises: a network selector connected to the user terminal for receiving and transferring user parameters and user's request for connecting to a particular information network, and for controlling the user terminal; a secure exchange, connected between each of the network selectors and the information networks, for authenticating the legality of the user parameters and request, and accepting or rejecting the user to access the requested particular information network based on the result of authentication. The present invention can both implement selection of information networks by the user and guarantee the security of the information networks.

(54) Title: A SYSTEM ENABLING A USER TO SELECT INFORMATION NETWORKS AND A METHOD THEREOF

(54) 发明名称: 一种实现用户选择信息网络的系统及其方法

(57) Abstract: A system which enables a user to select information networks and a method thereof. The system includes at least two information networks and user terminals, and further includes: network selectors, which are connected to the user terminals, for receiving and transferring user parameters and a request of users accessing a certain information network and controlling the user terminal; a security switch, which is connected between network selectors and information networks, for performing validity decision to the user parameters and the request, and granting to or refusing the user access to certain information network requesting to access according to the result of the decision. The present invention can not only realize users' selections of the information networks, but also guarantee the security of the information networks.
